

IFQ647 Assignment 1 Marking Guide: Performance Criteria (grade/level)

6-7		5	4	0-3	Marks allocation
Q1	The solution and code fully or largely meet all requirements, covering Tasks 1.1–1.3 in Q1, with correct outputs presented in the required text files.	The solution and code meet requirements, covering Tasks 1.1–1.3 in Q1, with correct outputs presented in the required text files.	The solution and code include most required functions for Tasks 1.1–1.3 in Q1. The code is executable and produces similar outputs in the required text files.	Only basic or limited requirements are met; major components are missing or flawed; requirements are largely unmet; or the solution or code is incorrect or non-functional.	7/20 Task1.1 3 marks Task1.2 2 marks Task1.3 2 marks
Q2	The answer and code fully or largely meet the requirements, covering the df, tf_idf, and main functions. The main function outputs are correctly displayed in the required text file, and the TF*IDF–based IR model is correctly tested on three titles.	The answer and code meet the requirements, covering the df, tf_idf, and main functions. The main function outputs are correctly displayed in the required text file, and the TF*IDF–based IR model is correctly tested on three titles.	The implementations of df, tf_idf, and main are acceptable. The main function outputs are presented in the required text file, and the TF*IDF–based IR model is tested with sensible results. The code is executable, but the outputs may be unsorted.	Only basic or limited requirements are met; major components are missing or flawed; requirements are largely unmet; or the solution or code is incorrect or non-functional.	4.5/20 1.5 marks for each task
Q3	The solution and code fully or largely meet the requirements. All functions (avg_len, bm_25, and main) are correctly implemented, with outputs properly shown in the required text file. The BM25-based IR model is tested on the required four queries and produces correct results.	The solution and code meet the requirements. All functions (avg_len, bm_25, and main) are correctly implemented, with outputs properly shown in the required text file. The BM25-based IR model is tested on the required four queries and produces correct results.	The implementations of avg_len, bm_25, and main are acceptable. The main function outputs are shown in the required text file, and the BM25-based IR model is tested with sensible results. The code is executable but may produce unsorted outputs.	Only basic or limited requirements are met; major components are missing or flawed; requirements are largely unmet; or the solution or code is incorrect or non-functional.	4.5/20 1.5 marks for each task
Q4	The solution and code fully or largely meet all requirements, covering Tasks 4.1 and 4.2 in Q4, with correct outputs presented in the required text files.	The solution and code meet requirements, covering Tasks 4.1 and 4.2 in Q4, with correct outputs presented in the required text files.	The solution and code include most required functions for Tasks 4.1 and 4.2 in Q4. The code is executable and produces similar outputs in the required text files.	Only basic or limited requirements are met; major components are missing or flawed; requirements are largely unmet; or the solution or code is incorrect or non-functional.	4/20 2 marks for each task
